

BALLARD MEADOW AND WOODLAND

ANNUAL REPORT FOR APRIL 2021 – MARCH 2022

Bluebells, Woar Copse

INTRODUCTION

This is the second annual report provided by The Friends of Ballard Water Meadow. Our work on the site is directed by the Management Plan (2020-2024) where we follow the Work Programme from which our Annual Work Plan is derived. Like many plans, and our work plan is no different, the majority of work has been achieved whilst some tasks, often outside our control, remain wanting.

1. RECORDING

Two types of records are kept; events which occur on-site that have a bearing on management or wildlife including volunteer effort (see below), and wildlife recording that is more structured taking the form of a detailed survey, census or transect.

There are plants which are associated with particular habitats and are known as Indicator Species. These are recorded annually, by individual compartment. Each of the meadow indicator species is assessed more closely in terms of either counts or the percentage cover over the ground (where individuals are too numerous to count easily), whereas the woodland element is recorded, simply as presence or absence. Results from the meadow in 2021 are shown in APPENDIX 1. All plants recorded to date by year, across the whole site (our Master List) is shown in APPENDIX 6.

The plant list is by no means complete and new species are recorded each year. In 2021 there were six new species found in the meadow (Sneezewort, Wavy Bitter-cress, Water Horsetail, Butterbur, Hairy Tare and Early Dog-violet) and four in the woodland (Pill Sedge, Rosebay Willowherb, Yellow Archangel and Wood Sage).

Heath Spotted-orchid, Ballard Meadow

There are a number of birds that use the site. An annual Common Bird Census is a way of assessing those birds which establish territories and may use the site for breeding. A bird seen in April for example, does not mean it is breeding but if recorded singing, or carrying nesting material, then it probably means it is establishing, or has, a territory. Full details of the census done for 2021, is available on the Friends of Ballard Water Meadows website and a summary is shown in APPENDIX 2.

New Milton Town Council and the Group jointly employed a local entomologist, Bryan Pinchen to undertake the second annual insect survey. The results have been posted both on the Town Council's and the Group's websites. A total of 338 species were recorded in 2021 (compared to 314 in 2020), 65 of which were new to the site this year. A summary of Bryan's work is shown in APPENDIX 3.

The Butterfly Transect undertaken on the site is registered as part of the UK Butterfly Monitoring Scheme. Butterflies are counted along a fixed route and the results feed into national records via local or County recorders. This way, across the country, the status of individual species is known year by year. This year, Ann Gorman, Pam Petherbridge, Rhona Copp, Mandy Hayes and Rosemary Deveraux-Jones contributed, and the 2021 transect summary is shown in APPENDIX 4.

New for 2021, is a stream survey, sampling water chemistry and macro-invertebrates, in association with the Freshwater Habitats Trust. It was intended to run from March to August, but this has been extended, sampling monthly throughout the year when there is a flow. Elsewhere in the New Forest, streams are sampled for their water chemistry, but as far as the Group can tell, macro-invertebrates are not sampled on a regular basis. Of particular note a juvenile newt (eft) was found in May, so we know they are breeding either on-site or close-by. The result of this work is shown in APPENDIX 5.

2. MANAGEMENT

2.1 Wildlife and Conservation Management

The water in the main north-south ditch running through Ballard Meadow attracts frogs to spawn each year. The developing tadpoles face many problems, the biggest threat being a dry spring and the ditches drying-out. Despite placing sandbags to hold water back, the ditch did dry-up in April. We have no idea if any tadpoles reached maturity.

Despite the fact that we had a dry April, the moist ground is particularly suitable for Hemlock Water-dropwort. This is a native wet meadow and streamside species, but in many places, it can become dominant over more delicate, wet meadow plants. We aim to control its spread as much as possible by cutting a proportion of the flowering heads in the spring, before it sets seed. We don't cut it across the whole site, as the flowers are attractive to a wide range of invertebrates. In April and May we were joined by the Fernhill Friends on a couple of occasions who helped to cut and remove a large proportion of this invasive species. The group had a final attempt to cut and remove more plants in a few selected locations during June.

In the woodland, where we have a proliferation of another invasive species, the non-native Three-cornered Garlic, we managed to cut as many flower-heads as possible. Like the Hemlock Water-dropwort, the aim is to prevent the plant seeding and spreading. We're hopeful that, over time, we will have removed the majority of plants. The tree guards put around the recently planted hazel saplings were removed in June, we cut-back Bramble from the path edges and cut Bracken to reduce its vigour, in the two glades.

From time to time there is a build-up of leaf litter and fallen branches in places along the stream. The Town Council is obliged to maintain a flow so group members keep vigilant on their behalf, removing any build-up of debris.

We aim to keep the most disruptive habitat management work to a minimum during the April to September period. Some habitat management does inevitably have to take place. Each year at the end of July or beginning of August we cut sections (compartments) of the Meadow. This removes the year's growth after the majority of plants have set seed, helps de-nutryfy the ground and allows a fresh-flush of growth before the livestock are re-introduced in September. We only managed to cut and clear a small area (M9) in early August due to equipment failure, but we hope to be back on track in 2022. We are grateful to the Town Council for taking away the piled-up cut material from all our vegetation clearance work.

The cattle arrived back on the Meadow in September. A local farmer has Dexters, a small and docile breed, ideally suited for our meadow and the number of people with dogs it attracts. On only very few occasions were dogs a nuisance, chasing the livestock.

There are a number of stakeholders in Ballard Meadow and Woodland and sometimes communication between the groups is challenging. In August contractors were engaged to fell trees, in the compartment where the Friends had recently planted some Hazel saplings. A few of these were destroyed in the process and all the material from the work was left on the ground and not cleared away; some actually left blocking a ditch. Then we had storms in October and November which caused a number of the older trees to become unsafe. A couple of large Oak trees adjacent to the stream also were felled to ground level. It is entirely possible to leave the bole(trunk) of the tree standing in these situations. It is perfectly safe and will provide a holdfast for Ivy and good wildlife habitat for countless generations of invertebrates.

A second compartment (W7) was cut and cleared of Bramble and some fallen timber, ready for restocking with Hazel saplings. This compartment had no old Hazel, only young trees so none was coppiced this time around. The Group was helped by Paul Brockman BEM and his school students. We also returned to the compartment cut in 2020/21 (W1) and coppiced some older hazel stools that were not attended to at that time. All work was completed by the end of February.

In the glades (W4 and W11), the vegetation was cut and cleared in October. One glade is rich in Bluebells, Red Campion and Foxglove whereas the other comprises deep leaf litter and remains fairly species-poor regarding woodland ground flora. As we continue the annual cutting regime, we're recording the flora and already a few new species are being seen, so it's only a matter of time before this glade also becomes rich in woodland wildflowers.

Each spring we apply for native hedgerow species for planting along the site boundary. These are supplied free of charge by the Woodland Trust and each year we receive either 30 or 60 plants, depending on the length we need to plant. In February we planted 60 saplings. We also planted around 200 Hazel saplings to fill the gaps in the newly cleared compartment as well as replacing those damaged by contractors in our first coppice compartment. These compartments will now be left to develop for 10 years and then cut again. At the time of writing the vast majority of saplings have taken well, despite April 2022 being one of the driest on record.

Hazel saplings planted in Cpt W7, Woar Copse

We took a couple of weeks off over the New Year and came back refreshed, cutting and pollarding willows in the Meadow, removing some of the non-native Evergreen Oak trees, clearing the brash (small branches and twigs) and making bonfires to get rid of it all. All of the larger pieces of timber are stacked in the woodland, to make wood walls. These provide habitat for invertebrates and fungi, as well as demarcating our compartments.

Bonfire, Cpt W4, Woar Copse

Storm Eunice toppled one of the larger Beech trees in February and in March contractors took out the crowns of two Oak trees to allow in more light to the glades. They also cleared-away the brash from the felled Oak trees beside the stream. Thankfully, the ground was really dry and little damage through ground compaction was evident.

Wood wall, Woar Copse

2.2 Infrastructure

The Group checks the infrastructure (gates, fences, bridges etc) on a regular basis. Small repairs we can do ourselves but the larger jobs require assistance and when anything fails, we inform the Town Council. This year new fencing was installed at the south-east corner access point and against the south-west corner main gate near our workbase.

Under the terms of the grazing licence, the grazier has to check and repair any failure in the fencing, ahead of the livestock being re-introduced. This year a couple of the larger corner/strainer posts were replaced.

2.3 Volunteer work effort

During the period 1st April 2021 to 31st March 2022 the Friends of Ballard Water Meadow volunteers, the Fernhill Friends and the school students' working parties clocked-up a total of 1522 man hours. We continue to meet twice weekly, Friday and Sunday mornings at 09.30 at our workbase on Lake Grove Road.

3. LIAISON AND ADMINISTRATION

The Friends of Ballard Water Meadow are grateful for the help and support from officers and members of New Milton Town Council and in particular, the Estates and Facilities Management Team.

Throughout the year the Group has worked closely with Fernhill Friends, who not only helped clear Hemlock Water-dropwort from the Meadow, but held a fund-raising quiz night, the proceeds of which were donated to the Friends of Ballard Water Meadow, for which we are grateful.

In order to increase our profile, as one of a number local community groups, we held an event in July to celebrate National Meadow Day and were joined by the New Forest Beekeepers. Also to do with bees, we received financial help from the Hampshire Biodiversity Information Centre (Hampshire County Council) to hold a workshop to train a number of the group in bumblebee identification.

Through our membership of Conservation Connection New Forest South, a small piece of ground was donated by the Town Council at the entrance to Fawcett's Field, where we sowed native wildflower seed in May which took well, and by July was blooming marvellous! We also joined-in with their celebrations at the Bee Fayre in September. Our own final fund-raising event was on New Milton market in December, selling gift packs of native wildflower seed.

We had three trips to visit other wildlife sites – a butterfly meadow in North Baddesley in July, then in early September, Studland Common, the Pleasure grounds and Sturt Pond with Milford Conservation Volunteers and later in the month, North Solent National Nature Reserve.

Members and officers of the Town Council, along with the New Forest Land Advice Service and the Friends of Ballard Water Meadow, were invited to support Ballard School in their project to plant trees and re-wild a small area of land in the school grounds, adjacent to Ballard Meadow. A plan was drawn-up and the locations for new trees was highlighted.

As part of our Community Involvement, the Chairman was invited to attend the Remembrance Day commemoration at the War Memorial in New Milton and a Christmas Carol service at St Mary Magdalene Church.

The Committee of the Friends of Ballard Water Meadow meet regularly every couple of months and before any event. Our Annual General Meeting was held at the Guide Hut in October. Two committee members resigned, but others were re-elected and we shall be recruiting one or two more to join us during 2022/23.

The Committee now comprises:

Chairman: Bob Lord
Secretary: Ann Gorman
Treasurer/Membership Secretary: Pam Petherbridge
Town Council Representative: Steve Clarke

4. MEMBERSHIP

The friends of Ballard Water meadow are grateful to all those who have renewed their membership for the year. As with all membership groups, there is a turnover and this year we welcomed several new members. Our membership for 2021/22 stands at 51.

5. ACKNOWLEDGEMENTS

As mentioned above, the Friends of Ballard Water Meadow cannot operate in isolation. As a not-for-profit group, we rely heavily on membership subscriptions and donations to keep us running. We have been more fortunate this year in being able to once again, generate some income from fund-raising events.

Many of the members have made donations, for which many thanks and this is gratefully received.

The Committee would particularly like to thank: Fernhill Friends, New Milton Residents' Association, New Milton Town Council, Paul Brockman and Priestlands School and last, but not least all the willing volunteers who help, come rain or shine.

Bob Lord
Chairman
Friends of Ballard Water Meadow

June 2022

6. APPENDICES

APPENDIX 1 – MEADOW INDICATOR SPECIES 2021

APPENDIX 2 – COMMON BIRD CENSUS 2021

APPENDIX 3 – INSECT SURVEY 2021

APPENDIX 4 – BUTTERFLY TRANSECT 2021

APPENDIX 5 – STREAM SURVEY 2021

APPENDIX 6 – UPDATED PLANT LIST (1998-2021)

APPENDIX 1 – BALLARD MEADOW INDICATOR SPECIES 2021

Species/Count		Compartment											
		M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11	M12

APPENDIX 2 – COMMON BIRD CENSUS 2021 (Summary)

A. BREEDING BIRDS

Common Name	Scientific Name	Territories
Stock Dove	<i>Columba oenas</i>	4 (5)
Woodpigeon	<i>Columba palumbus</i>	15 (16)
Great Spotted Woodpecker*	<i>Dendrocopus major</i>	1 (2)
Wren	<i>Troglodytes troglodytes</i>	11 (12)
Dunnock	<i>Prunella modularis</i>	8 (9)
Robin	<i>Erithacus rubecula</i>	14 (15)
Blackbird	<i>Turdus merula</i>	15 (16)
Song Thrush	<i>Turdus philomelos</i>	4
Blackcap	<i>Sylvia atricapilla</i>	4 (5)
Chiffchaff	<i>Phylloscopus collybita</i>	4
Goldcrest	<i>Regulus regulus</i>	2 (3)
Long-tailed Tit	<i>Aegithalos caudatus</i>	1 (2)
Coal Tit	<i>Parus ater</i>	3 (4)
Blue Tit	<i>Parus caeruleus</i>	14 (15)
Great Tit*	<i>Parus major</i>	8 (9)
Nuthatch*	<i>Sitta europaea</i>	4 (5)
Treecreeper*	<i>Certhia familiaris</i>	1
Jay	<i>Garrulus glandarius</i>	1
Magpie	<i>Pica pica</i>	1
Jackdaw*	<i>Corvus monedula</i>	1 (2)
Carrion Crow*	<i>Corvus corone</i>	3
Starling*	<i>Sturnus vulgaris</i>	2 (3)
House Sparrow	<i>Passer domesticus</i>	1 (2)
Chaffinch	<i>Fringilla coelebs</i>	4
Goldfinch	<i>Carduelis carduelis</i>	4 (5)

* - denotes nest (seen, bird at nest, entering nest site or young calling in nest)

B. NON-BREEDING BIRDS PRESENT ON ONE OR MORE OCCASIONS

Common Name	Scientific Name	Notes
Mallard	<i>Anas platyrhynchos</i>	2 pairs present in the stream and ditches on two visits
Green Woodpecker	<i>Picus viridis</i>	Male calling at north end of wood on two visits
Greenfinch	<i>Carduelis chloris</i>	Single male singing on two occasions in the woodland
Bullfinch	<i>Pyrrhula pyrrhula</i>	One adult male and a pair seen on two occasions in the woodland and in meadow

Data collected by: Bob Lord

Marbled White		1	
Speckled Wood	1	9	18
Gatekeeper	6	58	4
Meadow Brown	39	216	1

Extracted from: Ballard Water Meadow Transect Report (New Forest Transect Group/Friends of Ballard Water Meadow 2021).

Observers: Ann Gorman, Pam Petherbridge, Rhona Copp, Mandy Hayes, Rosemary Devereux-Jones

Other species recorded (B J Pinchen – not on transect):

Essex Skipper
Large Skipper
Painted Lady

APPENDIX 5 – STREAM SURVEY 2021

Introduction

Ballard stream is situated on the edge of the New Forest and runs along the east margin of the meadow. It is an important habitat and food source for many different organisms and the stream keeps the water table high in the meadow. The gravel bed and marginal vegetation are habitats which support freshwater invertebrates.

The stream has not been surveyed previously. Monitoring a stream is a practical method of looking at a freshwater ecosystem and from March to December the surveys were carried out monthly providing seasonal baseline data, during which severe changes in water quality can be identified.

The health of the stream and the freshwater invertebrates that live in it depend on good water quality. The abundance and occurrence of freshwater invertebrates can indicate water health. Some freshwater invertebrates are more tolerant of stressors in the form of pollutants than others. The stressors that affect the health of freshwater invertebrates are nutrient levels, slow flow, sediment and acidity. (Riverfly Partnership 2022). Worms, Midges, Snails, and Leeches are more tolerant of and muddy streams than Mayflies, Caddisflies and Stoneflies which need healthy lotic (flowing water) to survive. Sewage spills and predicted climate change with more adverse weather causing more frequent flash-flooding are an increasing threat to freshwater ecosystems.

Surveying the freshwater invertebrates living within the stream is useful in assessing stream health. As they are abundant, not extremely mobile and carry out part of or all their life cycle within the stream, freshwater invertebrates are exposed to the quality of the water on a continuous basis. The type and number found can relate directly to the water quality. The freshwater invertebrates live in the water, on and under rocks, vegetation, wood and debris. Some invertebrates feed on rotting leaves and wood and graze on algae, while others are predatory feeding on other invertebrates. Other freshwater invertebrates filter food from water cleaning the stream in the process.

Chemical Analysis

Water sample testing kits are used to determine nitrate and phosphate levels. High levels have a negative impact on biodiversity within the freshwater ecosystem. There is a chicken farm 700m north of the stream and building of a crematorium took place 700 metres north-west in April 2021. Both have the potential to impact the stream's health. The results of the analysis are shown in Table 1.

Kick Sampling Method

This is a standard method used for sampling stream freshwater macro invertebrates (those which can be seen with the naked eye) and other stream inhabitants. The same entry point at the stream is used each month. It involves disturbing the gravel bed and collecting the invertebrates that are dislodged. An industry standard flat-bottomed net is used. A standard kick sample is carried out for a 3-minute duration with an additional 1-minute stone-washing sample. As different invertebrates are found living in different habitats it is important to sample all habitats within the stream, marginal vegetation and shallow edges. Table 2 shows common freshwater invertebrates and other species and those found in Ballard Stream.

Comments

It is too early to draw conclusions, but it is interesting to note the proximity of a chicken farm 700 metres north of the stream. Of all animal manure, chicken manure is the highest in nitrates and phosphates. The results to date demonstrate that potential run off from farm and roads is not

impacting greatly on water quality. There is some evidence of eutrophication as elevated phosphate levels have been evident throughout the survey period. However, nitrate levels are more indicative of a mesotrophic or moderate nutrient state. As training has been successfully completed in 2022 to become a qualified Riverfly monitor, this also facilitates access to a national database where a biotic scoring system can be accessed. A biotic scoring system can further determine the water quality and health of a stream's ecosystem. Following the training undertaken, the 1-minute stone-washing exercise will run alongside the kick sampling exercise each month.

The small stream at Ballard Water Meadow has demonstrated overall good health with two of the more interesting species illustrated below.

Mayfly Olive

Newtlet (Eft)

Table 1 Chemical Analysis – results

Sample Date	Phosphate Levels	Nitrate Levels	Interpretation
19/03/21	0.02–0.05	0.5–1.0	Some evidence of nutrient pollution. Light rain 3 days prior to sampling
09/04/21	Less than 0.02	0.2–0.5	No evidence of nutrient pollution. Rain 3 days prior to sampling.
07/05/21	0.02–0.05	1–2	High level of pollution. No recent rain. Very poor flow.
19/06/21	0.02 –0.05	0.2–0.5	Some evidence of nutrient pollution. No recent rain. Stream flowing.
24/07/21	0.02–0.05	0.2–0.5	No evidence of nutrient pollution. Recent rain the day before. Stream flow weak.
August			Stream dry.
17/09/21	Less than 0.02	0.2	No evidence of nitrate or phosphate pollution. Recent light rain last 4 days.
22/10/21	0.02–0.05	0.5–1	Some evidence of nutrient pollution. Rain 2 days prior to sampling. Strong flow
19/11/21	Less than 0.02	0.2–0.5	Some evidence of nutrient pollution. Stream flow good. Recent rain last 4 days.
10/12/21	Less than 0.02	0.2	No evidence of nitrate or phosphate pollution. Fast flow.

Thanks to Freshwater Habitats for initial sampling kits and help with the process. More recent thanks to New Milton Town Council for funding future testing kits.

Table 2 Common Freshwater Species and those found in Ballard Stream 2021

The table shows the freshwater invertebrate groups and other species found in freshwater in the UK, and those present (X) in Ballard stream during March-December 2021 (Adapted from Extended Riverfly Groups Chart – Riverfly Partnership 2022). Note: no sample in August (stream dry).

The abundance and occurrence of freshwater invertebrates can indicate water quality. The stressors that affect the health of freshwater invertebrates and other species are nutrients, slow flow, sediment and acidity. Some invertebrates are more tolerant to stressors than others (Riverfly Partnership 2022).
